

Service Instructions

Tightening the UV Bulb & UV Chamber on the Crystal Pro

Form 1709001

Step One:

Remove the top screw on either side of the Crystal Pro rear panel and loosen the screw directly beneath it as well but do not remove it.

Using your thumbs, gently push the rear panel outward to allow the tabs holding the top panel in place to pop out of the cabinet. Then, gently push in the upper front left and right sides of the front panel to disengage the tabs and lift up the top cover.

Tightening the UV Bulb & UV Chamber on the Crystal Pro

Once the top is loosened, reach in and disconnect the wire connector from where it is plugged into the front panel. This will allow the front panel to be removed and set aside. After removing the top panel, gently tighten the UV bulb in the chamber by turning clockwise. This part should be hand tightened.

To reassemble, reverse the steps.
